PROFILE

Software engineer at Suncorp, one of Australia's largest financial services groups, with five years shipping production iOS apps, secure auth flows, vendor integrations and API-backed features for millions of customers. Strongest at turning ambiguous product or customer problems into architecture, implementation and release. Recently shipped a full-stack app to the App Store: SwiftUI front end, Supabase Postgres backend with RLS and Edge Functions, and Gemini-backed AI pipelines for structured data extraction and search. I use Claude Code and GitHub Copilot daily while owning code quality, testing and tradeoffs. Looking for a forward deployed or solutions engineering role where I work close to customers and ship reliable software quickly.

SKILLS

AI Engineering

Claude Code, GitHub Copilot, Gemini API, LLM pipeline design, prompt engineering, rapid prototyping, code review, technical discovery

Languages & Frameworks

Swift 6.1, SwiftUI, UIKit, Python, TypeScript, SQL, MVVM, Clean Architecture

Backend & Infra

Supabase (Postgres, Auth, RLS, Realtime, Storage, Edge Functions), Deno, REST APIs, APNs, JWT (ECDSA), Firebase, AWS, CI/CD, Jenkins, Xcode Cloud

Tools

Git / BitBucket, JIRA / Confluence, LaunchDarkly, Figma, Agile / Scrum, App Store Connect

EDUCATION

Bachelor of Information Technology

RMIT, Melbourne
Feb 2019 – Nov 2021

PROJECTS

Pub Thursdays | iOS App (full-stack, [live on the App Store](#), April 2026)

- Built a SwiftUI iPhone app for social groups running recurring pub nights: pub rotation, ratings, leaderboards, invites, card votes and APNs reminders, backed by an app-owned catalog of 506 Sydney venues.
- Designed a deterministic-first scraping pipeline extracting pub deals from venue websites and PDFs: rule-based pre-filtering, Gemini structured extraction, confidence scoring (0.93 avg), dedupe and human review for low-confidence results; 576 approved deals across 122 venues in production.
- Used Gemini behind Edge Functions for natural-language search parsing (with local fallback) and attribute tagging across 461 venues, with AI keys server-side and caching to control spend.
- Ran scheduled Deno/TypeScript Edge Function pipelines for catalog hydration, deal extraction and cleanup: 136/136 logged runs succeeded. Clean Architecture/MVVM codebase with RLS, SECURITY DEFINER RPCs, 105 SQL migrations and 340+ automated tests.

Bookkeeper | Web App (full-stack SaaS, in active development)

- Building a bookkeeping SaaS for solo operators in TypeScript with Next.js, Supabase and Vercel; auth, multi-tenant RLS data model and business profiles live.
- Implemented multi-tenant Xero OAuth 2.0 with PKCE, encrypted token storage via Postgres RPCs, advisory-lock refresh and Inngest background jobs, verified end to end against the Xero API.

EXPERIENCE

Software Engineer

Nov 2020 – Present

Suncorp Group, Sydney

- Key contributor on the iOS side of Suncorp's ForgeRock migration, rebuilding core authentication flows in Swift around REST API-backed token handling, session state and secure error paths. Worked with security/platform teams through release; login calls to the contact centre dropped 25% after launch.
- Led the mobile front-end migration for Suncorp's highest-priority program, moving insurance data to Duck Creek. Defined technical solutions so iOS and Android followed shared patterns, ran legacy and new logic side by side with LaunchDarkly feature flags, and coached the Android engineer through implementation.
- Drove the migration from legacy UIKit screens to SwiftUI and MVVM, creating reusable patterns the team could extend safely. Framed the case around release speed, maintainability and reduced implementation cost; feature delivery is now around 30% faster.
- Ship production iOS features from ambiguous requirements through implementation, testing and rollout, including the Rewards Platform, EcoScore sustainability module and Shannons app. Self-service work in the service app has contributed to call-centre contact rates falling more than 50% over my tenure.
- Integrated external vendor systems end to end, including Mastercard (rewards), CMT (telematics) and Adobe Analytics, owning API contract review, edge-case handling and production support; my integration decisions served as final production sign-off for the mobile team.
- Use GitHub Copilot and AI tooling across the dev lifecycle to draft code, explore architecture, write technical docs and speed up implementation while keeping review, testing and debugging standards high.
- Own the mobile release pipeline across Jenkins, Firebase, signing and App Store submissions. Manage build issues, dependencies and release comms so engineering work lands predictably and on time.

IT Salesperson

Dec 2019 – Jun 2024 (part-time)

JB Hi-Fi, Melbourne

- Ran customer-facing technical discovery every shift, separating the real problem from the requested product and translating needs into practical technical recommendations.
- Consistently exceeded sales targets with a consultative approach, solving complex home-office, education and AV setups by matching constraints to the right hardware/software mix.
- Built strong communication instincts for explaining technical tradeoffs clearly to non-technical customers, earning high CSAT and repeated formal positive feedback.

Technology Consultant

Sep 2019 – Jul 2020

BT Corporate Advisory, Melbourne

- Mapped the business's systems, workflows and pain points, then turned the findings into a prioritised technical roadmap leadership could act on.
- Scoped and delivered a full website rebuild, managing requirements, implementation and launch so the site accurately reflected the business and was easier to maintain.
- Implemented a Mailchimp email workflow to replace ad-hoc outreach, giving the team a repeatable system with tracking and better follow-up.
